NEUROSCAN AI - DIAGNOSTIC REPORT

Explainable Deep Learning-Based Brain Tumor Detection & Support System

Patient Name:	Janaki	**Scan Reference:**	SC-8
Patient ID:	PT-3783	**Modality:**	Coronal T1c
Age / Gender:	45 Yrs / Male	**AI Classifier:**	Meningioma (94.2%)
Analysis Date:	2026-08-30 17:21	**Model Version:**	DenseNet121 (v1.2)

AI Classification Probability Distributions

Diagnostic Class	Probability Weight
Glioma	1.9%
Meningioma	94.3%
Pituitary Tumor	1.9%
No Tumor	1.9%

Clinical Findings & AI Explanations

The network localized an extra-axial, dural-based mass displaying uniform enhancement. Localization contour tracing highlights boundaries around the parietal meningeal margins (Model Confidence: 94.2%). Voxel weights align with typical meningioma presentation. Recommend MRI perfusion validation.

CLINICAL DISCLAIMER NOTICE: This system provides AI-assisted analysis for research and decision-support purposes. AI predictions should not be interpreted as a standalone medical diagnosis and should be reviewed and authorized by a qualified healthcare professional/licensed neuro-radiologist.
